

YAMAHA SR1 Provider

Version 1.0.2

User's Guide

August 30, 2021

Remarks:

[Revision History]

Version	Date	Content
1.0.0	2012-10-31	First edition.
1.0.0	2013-04-26	Added the note for “echo-back” function of the YAMAHA controller.
1.0.1	2019-09-27	Fixed license check algorithm.
	2020-10-6	Addition of license addition items.
1.0.2	2021-08-30	Internal code optimization.

1. Introduction

This document is a user's guide for the single/double axis CAO provider for the YAMAHA robot SR1/DRCX series. The CAO provider described in this manual (CaoProvSR1.dll) is called the SR1 provider.

The next chapter provides the outline of the SR1 provider. Chapter 3 provides the command reference.

1.1. Emergency stop device position

A robot emergency stop switch should be prepared and set up near a robot operator before operating the robot, so that the switch can immediately stop the robot motion in an emergency situation.

- (1) The emergency stop switch should be red-colored.
- (2) After the emergency stop switch is activated, the switch should not return to normal (robot operating) position automatically or by other operator's careless action.
- (3) A robot emergency stop switch should be set up separately from the power switch.

1.2. Installing license

To use this Provider, you need to install ORiN2 SDK, and also need to input “YAMAHA Single-axis Robots Controller Provider” license information. If you would like to install it for evaluation, please use the following license.

SSEN-X1F6-3K4U-3PQU (valid for 3 months)

How to add the license is as follows.

1. Run the CaoConfig tool from the [Start] menu, and select the [Cao Provider] tab.
2. Select the [YAMAHA SR1 CAO Provider] item on the provider list.
3. Click the [...] button of the license input box.
4. Click the [Add] button in the "ORiN2 License Manager" window.
5. Input a license key, and click the [OK] button.
6. Click the [Close] button to exit.

Figure 1-1 Installing ' YAMAHA Single-axis Robots Controller Provider ' license

2. Outline of Provider

2.1. Outline

The SR1 provider is a CAO provider that absorbs the parts dependent on the YAMAHA robot controller and offers the functions defined in the CAO provider interface specifications. The file format is DLL (Dynamic Link Library) and the file is dynamically loaded by CAO engine when it is used. To use the SR1 provider, ORiN2SDK needs to be installed or registry needs to be manually registered according to the table below.

Table 2-1 SR1 provider

File name	CaoProvSR1.dll
ProgID	CaoProv.YAMAHA.SR1
Registry registration	regsvr32 CaoProvSR1.dll
Remove registry registration	regsvr32 /u CaoProvSR1.dll

2.2. Methods and properties

2.2.1. CaoWorkspace::AddController method

SR1 provider refers to the communication connection parameters passed when the AddController method is executed and connects communication.

The options specify the communication method and timeout period and, for Ethernet communications, the user name, password and Telnet port number.

When using Ethernet communication, disable “echo-back” function of the YAMAHA controller. Enabling the function will decrease the communication performance, and the echo-back data may be misrecognized by the YAMAHA provider.

Syntax AddController(<bstrCtrlName:BSTRT>,<bstrProvName:BSTRT>,
<bstrPCName:BSTRT>,<bstrOption:BSTRT>)

Following is a list of option string items.

Table 2-2 Option character string of CaoWorkspace::AddController

Option	Meaning
Conn=<Connection parameter>	Mandatory. Sets the communication method and connection parameters.
[User=<User name>]	Specify the user name to log in to the YAMAHA controller. (Default: admin)
[Password=<Password>]	Specify the password to log in. (Default: None)
[Timeout=<Timeout period>]	Specify the timeout period (msec) for transmission. (Default: 500)

2.2.1.1. Conn option

Following is communication parameter string for Conn option. Parameters inside square brackets (“[]”) can be omitted. Underlined parts represent the default values used when the option is not specified.

- **Ethernet device**

“Conn=eth:<IP Address>[:<PortNo>]”

<IP Address>: Mandatory. Destination IP address.

Example: ”127.0.0.1”, ”192.168.0.1”

<PortNo> : Destination port number.

Example: “127.0.0.1:23”, ”192.168.0.1:5010”

- **RS232C device**

“Conn=com:[<ComPort>”[:<BaudRate>[:<Parity>:<DataBits>:<StopBits>[:<Flow>]]]]”

<ComPort> : COM port number. '1'-COM1, '2'-COM2,...

<BaudRate> : Transmission rate.4800, 9600, 19200, 38400, 57600, 115200

<ByteSize> : Parity. 'N'-NONE, 'E'-EVEN, 'O'-ODD

<DataBits> : Number of data bits. '7'-7bit, '8'-8bit

<StopBits> : Number of stop bits. '1'-1bit, '2'-2bit

< Flow> : Flow control. '1'-Xon/Xoff. '2'-hardware control.

It is possible to specify it by taking OR.

(default: Flow control '0'-none)

2.2.2. CaoController::AddRobot method

The argument of the AddRobot method of the CaoController class specifies the robot name (BSTR type). The robot name specified here is an arbitrary string. A CaoRobot object is retrieved by calling the AddRobot method.

Syntax AddRobot(<bstrName:BSTR>[,<bstrOption:BSTR>])

< bstrName > : [in] Robot name (VT_BSTR)

< bstrOption > : [in] Option character string (not used)

2.2.3. CaoController::AddVariable method

The AddVariable method of CaoController class is a method for access to variables. In the SR1 provider, specify a system variable for the variable name.

Refer to Table 2-5 about the system variables implemented in the SR1 provider.

Syntax AddVariable(<bstrVariableName:VT_BSTR>[,<vntOption:VT_BSTR>])

< bstrVariableName > : [in] Variable name (VT_BSTR)

<bstrOption> : [in] Option character string

Example

```
-----
Dim aaa As Object
Dim bbb As Double

Set aaa = caoCtrl.AddVariable("@POS")
bbb = aaa.Value
-----
```

2.2.4. CaoController::Execute method

Execute the command.

The arguments of the Execute method specify a command as a BSTR and a parameter as a VARIANT array.

For details about commands, refer to "3Command Reference".

Syntax [`<vntRet:VT_VARIANT>=`]Execute(`<bstrCmd:VT_BSTR>`[,`<vntParam:VT_VARIANT>`])

`< vntRet >` : [out] Return value of command (VT_VARIANT)
`< bstrCmd >` : [in] Command (VT_BSTR)
`< vntParam >` : [in] Parameter (VT_VARIANT)

Example

```
-----
Dim vRes As Variant
vRes = caoCtrl.Execute("SRVO", 1) ' Servo ON
-----
```

2.2.5. CaoRobot::AddVariable method

The AddVariable method of CaoRobot class is a method for access to variables. In the SR1 provider, specify a system variable for the variable name.

Refer to Table 2-6 about the system variables implemented in the SR1 provider.

2.2.6. CaoRobot::Halt method

When a robot motion command of the CaoRobot class, such as the Move and Execute methods, is executed, the robot motion can be stopped using the Halt method.

2.2.7. CaoRobot::Move method

Move the robot to the specified position. The first argument specifies the Move command type, and the second argument specifies the destination information and speed in a VARIANT array. The following shows the argument specifications of Move.

Syntax Move `<lComp:VT_I4>`,`<vntParam : (VT_VARIANT | VT_ARRAY)>`

`< lComp >` : [in] Command number (VT_I4) Refer to Table 2-3.
`< vntParam >` : [in] Destination parameter array (VT_VARIANT | VT_ARRAY) Refer to Table 2-4.

Table 2-3 Move command first argument – MOV command correspondence table

First argument	Command	Explanation
1	MOVD	Move to the specified coordinate position.
2	MOVA	Move to the data position for the specified point number.
3	MOVI	Move as much as the data amount for the specified point number from the current position.
4	MOVF	Not used.
5	MOVL	DRCX (double axis) controller only. Move to the data position for the specified point number using linear interpolation.
6	MOVC	DRCX (double axis) controller only. Execute arc interpolation movement through the point specified by the number.
7	MOVM	Move to the specified pallet work position in the matrix.

Specify a destination parameter in the second argument as an array.

Table 2-4 Second argument parameter of Move command

MOV command	Second argument parameter	Remarks
MOVD	<X axis position (mm):VT_R8>,<Speed:VT_I4>	
MOVA	<Point number:VT_I4>,<Speed:VT_I4>	Point variable P can also be used in the point number.
MOVI	<Point number:VT_I4>,<Speed:VT_I4>	Point variable P can also be used in the point number.
MOVF	Not used.	Not used.
MOVL	<Point number:VT_I4>,<Maximum speed:VT_I4>	Point variable P can also be used in the point number.
MOVC	<Point number:VT_I4>,<Maximum speed:VT_I4>,<Path specification:VT_I4>	Point variable P can also be used in the point number.
MOVM	<Pallet work position:VT_I4>,<Speed:VT_I4>	For the pallet work position, specify a value between 1 and 65025 (255 × 255).

Example

- Example of using Move for single-axis controller

```
Dim aaa As Object
```

```
Set aaa = caoCtrl.AddRobot("AAA")
```

```
aaa.Move 1, Array(150.5, 100)
```

```
aaa.Move 2, Array(10, 50)
```

```
aaa.Move 3, Array(11, 30)
```

```
aaa.Move 7, Array(1, 100)
```

```
speed
```

```
' MOVD command: Move to 150.5 mm position at 100% speed
```

```
' MOVA command: Move to point number 10 at 50% speed
```

```
' MOVI command: Move as much as data amount at point  
number 11 from current position at 30% speed
```

```
' MOVN command: Move to matrix definition 1 position at 100%  
speed
```

- Example of using Move for double-axis controller

```
Dim aaa As Object
```

```
Set aaa = caoCtrl.AddRobot("AAA")
```

```
aaa.Move 5, Array(20, 100)
```

```
aaa.Move 6, Array(30, 50, 0)
```

```
' MOVL command: Move to point number 20 at 100% speed
```

```
' MOVN command: Move along arc path formed by three points,  
current position, point number 30, and point number 31, at 50%  
speed
```

2.2.8. CaoRobot::Execute method

Execute the robot-class command.

The arguments of the Execute method specify a command as a BSTR and a parameter as a VARIANT array.

For details about commands, refer to "3Command Reference".

Syntax

```
[<vntRet:VT_VARIANT>=]Execute(<bstrCmd:VT_BSTR>[,<vntParam:VT_VARIANT>])
```

```
< vntRet > : [out] Return value of command (VT_VARIANT)
```

```
< bstrCmd > : [in] Command (VT_BSTR)
```

```
< vntParam > : [in] Parameter (VT_VARIANT)
```

Example

```
Dim vRes As Variant
```

```
vRes = caoCtrl.Execute("SRVO", 1) ' Servo ON
```

2.2.9. CaoVariable::get_value property

Get the value of the variable corresponding to the object.

For details about the variable implementation status and data type, refer to Table 2-5, Table 2-6.

2.2.10. CaoVariable::put_value property

Set the value of the variable corresponding to the object.

For details about the variable implementation status and data type, refer to Table 2-5, Table 2-6.

2.3. Variable list

2.3.1. Controller class

Table 2-5 Controller class system variable list

Variable identifier	Data type	Explanation	Attribute	
			get	put
@VER	VT_BSTR	Get the version information of the controller.	√	-
@CLOCK	VT_BSTR	Get the total running time of the controller.	√	-
@EMG	VT_I2	Get the emergency stop status. 0: Emergency stop clear status, 1: Emergency stop status	√	-
@MODE	VT_I2	Get the status of the robot. 0: Stop status 1: Program running due to PC communications 2: Program running due to I/O command	√	-
@Timeout	VT_I4	Set/get the timeout period (msec) for communication.	√	√

2.3.2. Robot class

Table 2-6 Robot class system variable list

Variable identifier	Data type	Explanation	Attribute	
			get	put
@POS[n]	VT_R8	Get the current position of the robot. [n]: Axis number, 0: All axes, 1: X axis, 2: Y axis, Default: Single axis) The axis specification is used for DRCX (double axis) controller.	√	-
@NO	VT_BSTR	Get the program number of the currently running program. In multi task mode, this returns information about the program of the selected task. (Example) "10/1": No.1 is the first program and currently No.10 program is running.	√	-
@SNO	VT_BSTR	Get the current step number. In multi task mode, this returns information about the program of the selected task.	√	-
@TNO	VT_BSTR	Get the currently selected task number.	√	-
@PNO	VT_BSTR	Get the currently selected point number. In multi task mode, this returns information about the program of the selected task.	√	-
@MEM	VT_BSTR	Get the number of steps that can be added.	√	-
@ROBOT	VT_BSTR	Get the currently set robot type.	√	-
@PVA	VT_BSTR	Get the point variable P number. In multi task mode, this returns information about the program of the selected task. <Note> Range in which value retention is effective Power-off -> Retained Operation including a program reset -> Initialized to 0	√	-
@MSEL	VT_BSTR	Get the currently specified matrix pallet number. In multi task mode, this returns information about the program of the selected task.	√	-

@SHFT	VT_BSTR	Get the currently selected shift data. In multi task mode, this returns information about the program of the selected task.	√	-
@SRVO[n]	VT_I2	Get the servo status. 0: Servo OFF 1: Servo ON [n]: Axis number, 0: All axes, 1: X axis, 2: Y axis, Default: Single axis) The axis specification is used for DRCX (double axis) controller.	√	-
@ORG[n]	VT_I2	Get the origin return completion status. 0: Origin return not completed 1: Origin return completed [n]: Axis number, 0: All axes, 1: X axis, 2: Y axis, Default: Single axis) The axis specification is used for DRCX (double axis) controller.	√	-

2.4. Error code

In the SR1 provider, the following unique error codes are defined. For common ORiN2 errors, refer to the error code section in "[ORiN2 Programming Guide](#)".

Table 2-7 List of original error codes

Error name	Error code	Explanation
E_CAOP_NO_LICENSE	0x80100000	There is no license. Purchase an additional license.
SR1 command error	0x8011xxxx	If an error occurs while an SR1 command is executed, an error code with an error number in xxxx is returned. For description of error codes, refer to the SR1 manual.

3. Command Reference

This chapter explains the commands of the `CaoController::Execute` and `CaoRobot::Execute` methods. For detailed operation of the commands, refer to the YAMAHA Robot Controller User's Manual.

3.1. Controller class

Table 3-1 CaoController::Execute command list

Command	Function	
?ALM	Get the history of alarms that occurred in the past.	P.16
?ERR	Get the history of errors that occurred in the past.	P.17
?PRM	Get the specified parameter.	P.17
?STP	Get the total number of steps of a specified program.	P.18
ALMRST	Reset an alarm.	P.18
SendControlCode	Send a control command.	P.18
NativeSend	Send data via Telnet communications.	P.19
NativeReceive	Receive data via Telnet communications.	P.19

3.1.1. CaoController::Execute("?ALM") command

Get an alarm that occurred on the controller. Data can be acquired in a string array of <Number>,<Alarm date>,<Alarm description>. If the number of display is not specified, the latest alarm data is acquired.

For details about alarm description, refer to the YAMAHA Robot Controller User's Manual.

Syntax ?ALM (< vntAlmParam:VT_VARIANT >)

< vntAlmParam > : [in] Acquired alarm parameter (VT_VARIANT)

<INo>	History number: VT_I4
[<ICount>]	Number of display: VT_I4

Return value : [out] Alarm string array (VT_BSTR | VT_ARRAY)

Example

```
-----
Dim aaa As Variant
aaa = caoCtrl.Execute("?ALM", Array(0, 2))           ' Get two latest alarms
-----
```

3.1.2. CaoController::Execute("?ERR") command

Get an error that occurred on the controller. Data can be acquired in a string array of <Number>,<Error date>,<Error description>. If the number of display is not specified, the latest error data is acquired. For details about error description, refer to the YAMAHA Robot Controller User's Manual.

Syntax ?ERR (<vntErrParam:VT_VARIANT>)

< vntErrParam > : [in] Acquired error parameter (VT_VARIANT)

<INo>	History number: VT_I4
[<ICount>]	Number of display: VT_I4

Return value : [out] Error string array (VT_BSTR | VT_ARRAY)

Example

```
-----
Dim aaa As Variant
aaa = caoCtrl.Execute("?ERR", Array(0, 2)) ' Get two latest errors
-----
```

3.1.3. CaoController::Execute("?PRM") command

Get the setting parameters of the controller. Data can be acquired in an integer array of <Parameter number>,<Data>. If one array element is specified, data for one parameter is acquired. For details about parameters, refer to the YAMAHA Robot Controller User's Manual.

Syntax ?PRM (<vntParamData:VT_VARIANT>)

< vntParamData > : [in] Parameter data (VT_VARIANT)

<IBeginPrmNo>	Start parameter number
[<IEndPrmNo>]	End parameter number

Return value : [out] Parameter number and data (VT_I4 | VT_ARRAY)

Example

```
-----
Dim aaa As Variant
aaa = caoCtrl.Execute("?PRM", Array(110, 114)) ' Get parameter numbers 110 to 114
-----
```

3.1.4. CaoController::Execute("?STP") command

Get the total number of steps of a specified program. Data can be acquired in integer type.

Syntax ?STP (<IProgramNo:VT_I4>)

< IProgramNo > : [in] Program number (VT_I4)
Return value : [out] Total number of steps of the program (VT_I4)

Example

```
-----
Dim aaa As Variant
aaa = caoCtrl.Execute("?STP", 0) ' Get total number of steps of program number 0
-----
```

3.1.5. CaoController::Execute("ALMRST") command

Reset an alarm that occurred on the controller. Only a resettable alarm can be reset. For details about alarms that cannot be reset, refer to the YAMAHA Robot Controller User's Manual.

Syntax ALMRST ()

Return value : None

Example

```
-----
caoCtrl.Execute("ALMRST") ' Reset alarm
-----
```

3.1.6. CaoController::Execute("SendControlCode") command

Send a one-byte control code to the controller. For details about control codes, refer to the YAMAHA Robot Controller User's Manual.

Syntax SendControlCode (<bytCode:VT_UI1>)

< bytCode > : [in] Control code (VT_UI1)

0x03	^C: Abort ORG, XINC, XDEC, etc.
0x1A	^Z: End of data transmission
0x02	^B: Stop alarm message output

Return value : None

Example

```
-----
caoCtrl.Execute("SendControlCode", &H03)      ' Send ^C 0x03
-----
```

3.1.7. CaoController::Execute("NativeSend") command

Send data to the controller via Telnet communications. Specify the send command and parameters with a character string.

Syntax NativeSend (<bstrNativeText>)

<bstrNativeText > : [in] Data to send (VT_BSTR)
Return value : None

Example

```
-----
caoCtrl.Execute("NativeSend", "@?ALM 0,2")      ' Send parameter "0,2" with @?ALM command
-----
```

3.1.8. CaoController::Execute("NativeReceive") command

Receive data from the controller via Telnet communications. Get data sent from the controller as a character string. Character strings such as "OK c/r l/f" and "NG c/r l/f" are not included.

Syntax NativeReceive ()

Return value : [out] Data sent from the controller (VT_BSTR)

Example

```
-----
Dim aaa As String
aaa = caoCtrl.Execute("NativeReceive")          ' Receive data sent from controller
-----
```

3.2. Robot class

Table 3-2 CaoRobot::Execute command list

Command	Function	
ORG	Execute origin return.	P.21
SRVO	Turn ON/OFF the servo.	P.21
X+	Move the X axis in a plus direction for a distance of 1/100 the JOG movement speed.	P.22
X-	Move X axis in a minus direction for a distance of 1/100 the JOG movement speed.	P.22
Y+	Move Y axis in a plus direction for a distance of 1/100 the JOG movement speed.	P.22
Y-	Move Y axis in a minus direction for a distance of 1/100 the JOG movement speed.	P.23
XINC	Keep moving the X axis in a plus direction at the JOG movement speed.	P.23
XDEC	Keep moving the X axis in a minus direction at the JOG movement speed.	P.24
YINC	Keep moving the Y axis in a plus direction at the JOG movement speed.	P.24
YDEC	Keep moving the Y axis in a minus direction at the JOG movement speed.	P.25
DRVD	Move the specified axis to the specified coordinate position.	P.25
DRVA	Move the specified axis to a point data position.	P.26
DRVI	Move the specified axis as much as a point data amount from current position.	P.26
ACHA	Define the arch motion with a position specified.	P.27
ACHI	Define the arch motion with a distance specified.	P.27
P	Set point variable P.	P.28
P+	Add 1 to point variable P.	P.28
P-	Subtract 1 from point variable P.	P.29
MAT	Define a matrix.	P.29
MSEL	Set a matrix number to be used for matrix movement of the Move method.	P.30
SHFT	Shift the position data as much as the specified point data amount.	P.30
WRITE	Write point data.	P.31
?P	Get the specified point data.	P.31
?MAT	Get the specified matrix data.	P.32

3.2.3. CaoRobot::Execute("X+") command

Move the X axis in a plus direction for the distance specified by the following expression:

$$\text{Distance (mm)} = 1 \times (\text{PRM201}/100) \quad \text{PRM201:JOG movement speed (mm/s)}$$

Syntax X+ ()

Return value : None

Example

```
-----
Dim aaa As Object

Set aaa = caoCtrl.AddRobot("AAA")
aaa.Execute("X+") ' Move X in plus direction by (PRM201)/100
-----
```

3.2.4. CaoRobot::Execute("X-") command

Move the X axis in a minus direction for the distance specified by the following expression:

$$\text{Distance (mm)} = 1 \times (\text{PRM201}/100) \quad \text{PRM201:JOG movement speed (mm/s)}$$

Syntax X- ()

Return value : None

Example

```
-----
Dim aaa As Object

Set aaa = caoCtrl.AddRobot("AAA")
aaa.Execute("X-") ' Move X in plus direction by (PRM201)/100
-----
```

3.2.5. CaoRobot::Execute("Y+") command

Command for DRCX only.

Move the Y axis in a plus direction for the distance specified by the following expression:

$$\text{Distance (mm)} = 1 \times (\text{PRM12}/100) \quad \text{PRM12: Teach movement data (\%)}$$

If the robot is the rotation axis, the unit is deg/sec.

Syntax Y+ ()

Return value : None

Example

```

-----
Dim aaa As Object

Set aaa = caoCtrl.AddRobot("AAA")
aaa.Execute("Y+")           ' Move Y in plus direction by (PRM12)/100
-----

```

3.2.6. CaoRobot::Execute("Y-") command

Command for DRCX only.

Move the Y axis in a minus direction for the distance specified by the following expression:

Distance (mm) = 1 x (PRM12/100) PRM12: Teach movement data (%)

If the robot is a rotation axis, the unit is deg/sec.

Syntax Y- ()

Return value : None

Example

```

-----
Dim aaa As Object

Set aaa = caoCtrl.AddRobot("AAA")
aaa.Execute("Y-")           ' Move Y in minus direction by (PRM12)/100
-----

```

3.2.7. CaoRobot::Execute("XINC") command

Keep moving the X axis in a plus direction at PRM201 (JOG movement speed) until a control code (^C) is entered or the software limit is reached.

[Attention]

The software limit is not effective until origin return is completed.

Syntax XINC ()

Return value : None

Example

```

-----
Dim aaa As Object

Set aaa = caoCtrl.AddRobot("AAA")
aaa.Execute("XINC")         ' Keep moving X in plus direction at JOG movement speed
-----

```

3.2.8. CaoRobot::Execute("XDEC") command

Keep moving the X axis in a minus direction at PRM201 (JOG movement speed) until a control code (\hat{C}) is entered or the software limit is reached.

[Attention]

The software limit is not effective until origin return is completed.

Syntax XDEC ()

Return value : None

Example

```
-----  
Dim aaa As Object  
Set aaa = caoCtrl.AddRobot("AAA")  
aaa.Execute("XDEC") ' Keep moving X in minus direction at JOG movement speed  
-----
```

3.2.9. CaoRobot::Execute("YINC") command

Command for DRCX only.

Keep moving the Y axis in a plus direction at PRM201 (JOG movement speed) until a control code (\hat{C}) is entered or the software limit is reached. If the robot is a rotation axis, the unit is deg/sec.

[Attention]

The software limit is not effective until origin return is completed.

Syntax YINC ()

Return value : None

Example

```
-----  
Dim aaa As Object  
Set aaa = caoCtrl.AddRobot("AAA")  
aaa.Execute("YINC") ' Keep moving Y in plus direction at JOG movement speed  
-----
```

3.2.10. CaoRobot::Execute("YDEC") command

Command for DRCX only.

Keep moving the Y axis in a minus direction at PRM201 (JOG movement speed) until a control code (\hat{C}) is entered or the software limit is reached. If the robot is a rotation axis, the unit is deg/sec.

[Attention]

The software limit is not effective until origin return is completed.

Syntax YDEC ()

Return value : None

Example

```
-----
Dim aaa As Object

Set aaa = caoCtrl.AddRobot("AAA")
aaa.Execute("YDEC") ' Keep moving Y in plus direction at JOG movement speed
-----
```

3.2.11. CaoRobot::Execute("DRVD") command

Command for DRCX only.

Move the specified axis to the specified coordinate position.

Syntax DRVD (<vntDRVParam:VT_VARIANT | VT_ARRAY>)

< vntDRVParam > : [in] Drive information (VT_VARIANT | VT_ARRAY)

Array data:

< vntAxis >	Axis number 1: X axis, 2: Y axis
<vntPosition>	Movement position (mm) when the robot is set to a rotation axis (deg)
< vntSpeed >	Speed: 1 to 100

Return value : None

Example

```
-----
Dim aaa As Object

Set aaa = caoCtrl.AddRobot("AAA")
aaa.Execute("DRVD", Array(1,150.55,100)) ' Move X axis to X=150.55 position at 100% speed
-----
```

3.2.12. CaoRobot::Execute("DRVA") command

Command for DRCX only.

Move the specified axis to the specified point data position.

Syntax DRVA (<vntDRVParam:VT_VARIANT | VT_ARRAY>)

< vntDRVParam > : [in] Drive information (VT_VARIANT | VT_ARRAY)

Array data:

< vntAxis >	Axis number 1: X axis, 2: Y axis
<vntPointNo>	Point number: 0 to 999 Point variable P can also be used.
< vntSpeed >	Speed: 1 to 100

Return value : None

Example

Dim aaa As Object

Set aaa = caoCtrl.AddRobot("AAA")
aaa.Execute("DRVA", Array(1,123,100))

' Move X axis to point 123 at 100% speed

3.2.13. CaoRobot::Execute("DRVI") command

Command for DRCX only.

Move the specified axis by the specified point data position amount from the current position.

Syntax DRVI (<vntDRVParam:VT_VARIANT | VT_ARRAY>)

< vntDRVParam > : [in] Drive information (VT_VARIANT | VT_ARRAY)

Array data:

< vntAxis >	Axis number 1: X axis, 2: Y axis
<vntPointNo>	Point number: 0 to 999 Point variable P can also be used.
< vntSpeed >	Speed: 1 to 100

Return value : None

Example

```
Dim aaa As Object
```

```
Set aaa = caoCtrl.AddRobot("AAA")
aaa.Execute("DRVI", Array(2,150.55,100))
```

```
Move Y axis as much as point 123 data amount from
current position at 100% speed
```

3.2.14. CaoRobot::Execute("ACHA") command

Command for DRCX only.

Define the arch motion with a position specified (absolute position in reference to origin).

Syntax ACHA (<vntACHParam:VT_VARIANT | VT_ARRAY>)

< vntACHParam > : [in] Arch information (VT_VARIANT | VT_ARRAY)

Array data:

< vntAxis >	Axis number 1: X axis, 2: Y axis
< vntPosition >	Specifiable position: -9999 to 9999 (mm)

Return value : None

Example

```
Dim aaa As Object
```

```
Set aaa = caoCtrl.AddRobot("AAA")
aaa.Execute("ACHA", Array(2,10))
```

```
' Arch motion definition to return to Y=10.00 point
```

3.2.15. CaoRobot::Execute("ACHI") command

Command for DRCX only.

Define the arch motion with a position specified (relative position in reference to the current position).

Syntax ACHI (<vntACHParam:VT_VARIANT | VT_ARRAY>)

< vntACHParam > : [in] Arch information (VT_VARIANT | VT_ARRAY)

Array data:

< vntAxis >	Axis number 1: X axis, 2: Y axis
< vntPosition >	Specifiable distance: -9999 to 9999 (mm)

Return value : None

Example

```

-----
Dim aaa As Object

Set aaa = caoCtrl.AddRobot("AAA")
aaa.Execute("ACHI", Array(2,-100)) ' Arch motion definition to return for distance of Y=-100.00
-----

```

3.2.16. CaoRobot::Execute("P") command

Set point variable P. A point number between 0 and 999 can be specified.

[Attention]

Although the point variable data is retained even if the controller power is turned OFF, an operation that causes a program reset initializes the point variable to 0.

Syntax

P (<IPNo:VT_I4>)

<IPNo > : [in] Point number (VT_I4): A point number between 0 and 999
 Return value : None

Example

```

-----
Dim aaa As Object

Set aaa = caoCtrl.AddRobot("AAA")
aaa.Execute("P", 100) ' Set point variable P to 100
-----

```

3.2.17. CaoRobot::Execute("P+") command

Add 1 to point variable P.

Syntax

P+ ()

Return value : None

Example

```

-----
Dim aaa As Object

Set aaa = caoCtrl.AddRobot("AAA")
aaa.Execute("P", 100) ' Set point variable P to 100
aaa.Execute("P+") ' Set point variable P to 101 (P <- P+1)
-----

```

3.2.18. CaoRobot::Execute("P-") command

Subtract 1 from point variable P.

Syntax P- ()

Return value : None

Example

```
-----
Dim aaa As Object

Set aaa = caoCtrl.AddRobot("AAA")
aaa.Execute("P", 100)           ' Set point variable P to 100
aaa.Execute("P-")              ' Set point variable P to 99 (P <- P-1)
-----
```

3.2.19. CaoRobot::Execute("MAT") command

Define a matrix. The numbers of rows and columns can be set to a value between 1 and 255. The pallet number can be set to a unique value between 0 and 31.

Syntax MAT (<vntMatParam:VT_I4 | VT_ARRAY>)

< vntMatParam > : [in] Matrix definition information (VT_I4 | VT_ARRAY)

Array data:

< IRowCount >	Number of rows: 1 to 255
< IColCount >	Number of columns: 1 to 255
<IPalltNo>	Pallet number: 0 to 31

Return value : None

Example

```
-----
Dim aaa As Object

Set aaa = caoCtrl.AddRobot("AAA")
aaa.Execute("MAT", Array(5,2,1)) ' Set 5 x 2 matrix for first pallet
-----
```

3.2.20. CaoRobot::Execute("MSEL") command

Syntax MSEL (<IPalletNo:VT_I4>)

< IPalletNo > : [in] Pallet number (VT_I4)
Pallet number between 0 and 31 for matrix identification

Return value : None

Example

```
-----
Dim aaa As Object

Set aaa = caoCtrl.AddRobot("AAA")
aaa.Execute("MAT", Array(5,2,1))      ' Set 5 x 2 matrix for first pallet
aaa.Execute("MSEL", 1)                ' Select first pallet
aaa.Move 7, Array(1,100)              ' Move to first pallet position at 100% speed
-----
```

3.2.21. CaoRobot::Execute("SHFT") command

Shift the position data as much as the specified point data amount.

This is valid until the SHFT statement is executed again or a program reset occurs.

Syntax SHFT (<IPointNo:VT_I4>)

< IPointNo > : [in] Point number (VT_I4): A point number between 0 and 999

Return value : None

Example

```
-----
Dim aaa As Object

Set aaa = caoCtrl.AddRobot("AAA")
aaa.Execute("SHFT", 1)                ' Data amount shift setting for point number 1
-----
```

3.2.22. CaoRobot::Execute("WRITE") command

Write point data. To write point data, specify a string array. Points to which data is written do not need to be sequential numbers.

Syntax WRITE (<vntPointData:VT_BSTR | VT_ARRAY>)

< vntPointData > : [out] Point setting string (VT_BSTR | VT_ARRAY)

Px=<Position data>	x: Point number
	The position data is VT_R8.

Return value : None

Example

```
-----
Dim aaa As Object

Set aaa = caoCtrl.AddRobot("AAA")
aaa.Execute("WRITE", Array("P0=0.00", "P1=350.00", "P254=-0.27")) ' Write to point
-----
```

3.2.23. CaoRobot::Execute("?P") command

Get point data at the specified point number. The first argument specifies the point number at which data is to be acquired as an array. To acquire only one point, specify an array with one element. Point data at unregistered point numbers is skipped.

Syntax ?P (<vntPointData:VT_I4 | VT_ARRAY>)

< vntPointData > : [in] Point number (VT_I4| VT_ARRAY)

<IBeginPointNo>	Point number: VT_I4
[<IEndPointNo>]	Point number: VT_I4

Return value : [out] Point number (VT_BSTR |VT_ARRAY)

P(IBeginPointNo) = Position data,...

, P(IEndPointNo) = Position data array

Example

```
-----
Dim aaa As Object

Set aaa = caoCtrl.AddRobot("AAA")
aaa.Execute("?P", Array(15,24)) ' Get data for point numbers from 15 to 24
-----
```

3.2.24. CaoRobot::Execute("?MAT") command

Get the matrix definition. Specify a unique number between 0 and 31 for matrix identification.

Syntax ?MAT (<IMatNo:VT_I4>)

< IMatNo > : [in] Matrix number (VT_I4)

Return value : [out] Matrix definition data (VT_I4 | VT_ARRAY)

Number of rows	VT_I4
Number of columns	VT_I4

Example

Dim aaa As Object

Set aaa = caoCtrl.AddRobot("AAA")

aaa.Execute("?MAT", 1) ' Get data for pallet number 1
